"Special evolution of neurohypophysial hormones in cartilaginous fishes: asvatocin and phasvatocin, two oxytocin-like peptides isolated from the spotted dogfish (Scyliorhinus caniculus).";

Proc. Natl. Acad. Sci. U.S.A. 91:11266-11270(1994).

-!- FUNCTION: DISPLAYS OXYTOCIC ACTIVITY ON RAT UTERUS.

-!- SIMILARITY: BELONGS TO THE VASOPRESSIN/OXYTOCIN FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Indels

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The inventors claim synthetic peptides which correspond to sequences occurring in BGF, but excluding BGF. The peptides are angiogenic and have corresp, applications, eg for the healing of wounds and burns. Their relative shortness means that they pose fewer synthesis problems than the entire BGF molecule. They can be admin. singly or association with each other or in association with an angiogenic
                                                                                                                                                                                                                                                               to residues 12-14 of naturally occurring

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The article for inactivating a toxic material comprises a solid carrier bearing a first receptor which binds the target ligand and a second receptor which degrades the target ligand. This synthetic peptide is a preferred first receptor. The article may be used for covering surfaces to protect or decontaminate the surface. The article is esp. for degrading toxic organic openic spp. sep. organophosphorous opds., (eg pesticides and nerve poisons, bacteria and viruses, in environmental, chemical, military and industrial settings.
                                                                                         The inventors claim the prepn. of new cysteine peptides with insulin-
                                                                                                       like activity. The new peptides comprise a sequence with corresp. to a central portion of the insulin B chain (esp. B15-27) and a cysteine-contg. peptide with an AA sequence corresp. to a terminal portion of the insulin A chain (esp. A1-7). The new cysteine peptides are antidiabetic agents with appreciable insulin activity (lower than that of insulin itself) and low antigenic activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Article for inactivating toxic materials, eg organo:phosporous cpds. comprises solid carrier bearing target ligand binding receptor and ligand-degrading receptor, pref. enzyme

```
The acyclic peptide (see R31340) with metal trapping activity may be produced by fragment condensation using the peptide fragments given in R34022-29.
                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Increasing growth of birds - with insulin-like growth factor delivered to the egg before hatching esp. for increasing wt. gain in chickens.
New acyclic peptide with metal trapping activity - exhibits in vivo metal transporting action and can be used as drug, diagnostic agent: or functional material
                                                                                                                                                                                                                                                                                                                                                                                                                               ;

                                                                                                                                                                                                                                                                                                                                                                                                                            Growth of birds is increased by (a) admin. to the bird, in ovo, insulin-like growth factor (IGF)-1 or -2 or their active analogues; (b) incubating to hatch and (c) growing the birds for at least 3 weeks after hatch.

IGF-1 analogues used pref. (i) lack 1-5 N-terminal amino aicds or (ii) have Glu(3) absent or replaced by Gly, Gln, Leu, Arg or Lys, partic. Gly and the Thr normally adjacent to Glu can be replaced by Arg or Gly. The IGF-1 analogue pref. comprises the N-terminal Gly in R51439-49.

IGF-2 analogues used pref. have Glu(2) or Glu(3) absent or replaced by Gly. Gln, Leu, Arg or Lys, partic. Gly and the Thr normally adjacent to Glu can be replaced by Arg or Gly. The IGF-2 analogue pref. Comprises the N-terminal given in R51450-53.

Exp. Long R3 IGF-1, given in R51454 is used. It is the full human IGF-1 sequence with Arg replacing Glu(3) and a 13 amino acid

weeks after hatch.

IGF-1 analogues used pref. (i) lack 1-5 N-terminal amino aicds or (ii) have Glu(3) absent or replaced by Gly, Gln, Leu, Arg or Lys, partic. Gly and the Thr normally adjacent to Glu can be replaced by Arg or Gly. The IGF-1 analogue pref. comprises the N-terminal given in R51439-49.

IGF-2 analogues used pref. have Glu(2) or Glu(3) absent or replaced by Gly, Gln, Leu, Arg or Lys, partic. Gly and the Thr normally adjacent to Glu can be replaced by Arg or Gly. The IGF-2 analogue pref. comprises the N-terminal given in R51450-53.

Bsp. Long R3 IGF-1, given in R51454 is used. It is the full human IGF-1 sequence with Arg replacing Glu(3) and a 13 amino acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Growth of birds is increased by (a) admin. to the bird, in ovo, insulin-like growth factor (IGF)-1 or -2 or their active analogues; (b) incubating to hatch and (c) growing the birds for at least 3 weeks after hatch.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          IGF-I analogues used pref. (1) lack 1-5 N-terminal amino aicds or (11) have Glu(3) absent or replaced by Gly, Gln, Leu, Arg or Lys, partic. Gly and the Thr normally adjacent to Glu can be replaced by Arg or Gly. The IGF-I analogue pref. comprises the N-terminal given in R51439-49.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Increasing growth of birds - with insulin-like growth factor delivered to the egg before hatching esp. for increasing wt. gain

```
W56171-248 represent anti-inflammatory tripeptides of the invention. They are derived from the formulae:
Xaa-Glu-Arg, Arg-Glu-Xaa, Xaa-Arg-Glu, or Glu-arg-Xaa, where
Xaa = any amino acid residue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Anti-inflammatory peptides and derivatives - used for treating, e.g arthritis, ulcerative colitis, auto-immune disease, allergy asthma, shock, HIV infection, transplant rejection or Alzheimer's disease
                                                                                                                                                                                                                                                                                        Anti-inflammatory; macrophage inhibitory activity; fibronectin; T-cell inhibitory activity; adherence; extracellular matrix; up-regulation; fas receptor expression; inflammation.

IGF-2 analogues used pref. have Glu(2) or Glu(3) absent or replaced by Gly, Gln, Leu, Arg or Lys, partic: Gly and the Thr normally adjact to Glu can be replaced by Arg or Gly. The IGF-2 analogue pref. comprises the N-terminal given in R51450-53. Esp. Long R3 IGF-1, given in R51454 is used. It is the full human IGF-1 sequence with Arg replacing Glu(3) and a 13 amino acid N-terminal extension.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Interleukin-12; Fc gamma-1; immunosuppressive; autoimmune disease; graft rejection; toxic shock; therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               A peptide (W19847) comprises the three N-terminal amino acid residues of human interleukin-12 (IL-12) p40 subunit. It is encoded both by native human p40 cDNA (T72095) and by a primer (T72095) based on the native sequence. PCR amplification has been used to amplify p40 cDNA. A fusion protein comprising the p40 subunit and human FC gamma-1 (see also W19853) was expressed in E. coli. This fusion protein has a longer in vivo half-life than native p40 and can be used as an immunosuppressive (e.g. to treat autoimmune diseases or to inhibit graff rejection) or to treat or prevent endotoxin-induced shock.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Fusion protein containing interleukin-12 p40 sub-unit - has increased stability, used to inhibit graft rejection, or treat autoimmune disease and endotoxin-induced shock

Cyclic derivatives of the peptides also function as anti-inflammatory agents. The peptides can be covalently linked to one another either directly or through a spacer. The peptides and their derivatives have macrophage inhibitory and T-cell inhibitory activity and thus, anti-inflammatory activity. The peptides and compositions have anti-inflammatory activity. I.e. inhibitory effects against a cellular and humoral immune response, including a response not associated with inflammation. The peptides also inhibit the ability of macrophages and reals to adhere to extracellular matrix components and fibronectin, as well as up-regulated fast receptor expression in T-cells. They can be used to inhibit unwanted immune reaction and inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

They are derived from the formulae:

Xaa -Glu-Arg, Arg-Glu, xaa, Xaa -Arg-Glu, or Glu-arg-Xaa, where
Xaa - any amino acid residue.

Yaa any amino acid residue.

Cyclic derivatives of the peptides also function as anti-inflammatory agents. The peptides can be covalently linked to one another either directly or through a spacer. The peptides and their derivatives have macrophage inhibitory and T-cell inhibitory activity and thus, anti-inflammatory activity. The peptides and compositions have anti-inflammatory activity. The peptides and compositions have anti-inmune activity, i.e. inhibitory effects against a cellular and humoral immune response, including a response not associated with inflammation. The peptides also inhibit the ability of macrophages and T-cells to adhere to extracellular matrix components and fibronectin, as well as up-regulated fas receptor expression in T-cells. They can be used to inhibit unwanted immune reaction and inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                             Anti-inflammatory peptides and derivatives - used for treating, e.g. arthritis, ulcerative colitis, auto-immune disease, allergy asthma, shock, HIV infection, transplant rejection or Alzheimer's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                W56171-248 represent anti-inflammatory tripeptides of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          They are derived from the formulae:

Xaa-Glu-Arq, Arg-Glu-Xaa. Xaa-Arg-Glu, or Glu-arg-Xaa, where
Xaa = any amino acid residue.

Yaa-Glu-Arq, Arg-Glu-Xaa and Arg-Glu, or Glu-arg-Xaa, where
Yaa = any amino acid residue.

Cyclic derivatives of the peptides also function as anti-inflammatory
agents. The peptides can be covalently linked to one another either
directly or through a spacer. The peptides and their derivatives have
macrophage inhibitory and T-cell inhibitory activity and thus,
anti-inflammatory activity. The peptides and compositions have
anti-inmune activity, i.e. inhibitory effects against a cellular and
humoral immune response, including a response not associated with
inflammation. The peptides also inhibit the ability of macrophages and
r-cells to adhere to extracellular matrix components and fibronectin, as
well as up-regulated fas receptor expression in T-cells. They can be used
to inhibit unwanted immune reaction and inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Anti-inflammatory peptides and derivatives - used for treating, e.g. arthritis, ulcerative colitis, auto-immune disease, allergy asthma, shock, HIV infection, transplant rejection or Alzheimer's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              W56171-248 represent anti-inflammatory tripeptides of the invention.
                                                                                                                                                            Anti-inflammatory, macrophage inhibitory activity; fibronectin; T-cell inhibitory activity; adherence; extracellular matrix; up-regulation; fas receptor expression; inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

                                                                                                                                                                                      Peptides W88033-39 are used in the hair composition of the invention. The specification describes a hair composition that comprises at least one oligoceptide having more than two cysteine residues and more
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Biostatin preparation in high yield by solid synthesis, including closure of disulfide bridge before cleavage from support, useful as antitumor agent -
                                                                                                    New composition for hair - comprises oligopeptide having more than cysteine residues and reducing agent
                                                                                                                                                                                                                                         than three amino acid residues of the same kind (except cysteine) a reducing agent. The composition is useful for styling hair to take various shapes and waves safely and effectively.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     /note= "Thr(tBu) with C-terminal amide group"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                              Na = any annio acid residue.

Cyclic derivatives of the peptides also function as anti-inflammatory agents. The peptides can be covalently linked to one another either directly or through a spacer. The peptides and their derivatives have macrophage inhibitory and T-cell inhibitory activity and thus, anti-inflammatory activity. The peptides and compositions have anti-inflammatory activity. The peptides and compositions have incliamme activity, i.e. inhibitory effects against a cellular and humoral immune response, including a response not associated with inflammation. The peptides also inhibit the ability of macrophages and T-cells to adhere to extracellular matrix components and fibronectin, as well as up-regulated fas receptor expression in T-cells. They can be used to inhibit unwanted immune reaction and inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                         Anti-inflammatory peptides and derivatives - used for treating, e.g. arthritis, ulcerative colitis, auto-immune disease, allergy asthma, shock, HIV infection, transplant rejection or Alzheimer's disease
                                                                                                                                                                                                                                                                                                                                                                                                                 W56171-248 represent anti-inflammatory tripeptides of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                               They are derived from the formulae:
Xaa-Glu-Arg, Arg-Glu-Xaa, Xaa-Arg-Glu, or Glu-arg-Xaa, where

This invention describes a novel method for the solid phase (SP)

Synthesis of biostatin (TT 232) (I) which includes closing the disulfide bridge by oxidation of the completely or partially constructed peptide while still bonded to the solid phase. The products of the invention have cytostatic activity and are tyrosine kinase inhibitors. (I) inhibits the tyrosine kinase activity of various human stomach cancer cell lines and thus inhibits cellular proliferation. The heptapeptide (I) described in the invention is a somatostatin analog which shows strong antitumor cativity in vitro and in vivo. The SP synthesis method gives (I) is more easily and in markedly higher yield than by the method of EP50580, in which the cyclization is carried out after cleaving the peptide from the casin. The solution method is also a simple synthesis of (I) in high yield of typically the tert-butyl-protected precursor can be oxidized in a yield of 70-80%. Y51896-Y51900 represent peptides used in the synthesis of biostatin TT232 described in the method of the invention.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Description
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sednence

Patent No. 5792629
GENERAL INFORMATION:
APPLICANT: MORIBITA, Hideaki
APPLICANT: MOBUHARA, Masahiro
TITLE OF INVENTION: POLYPEPTIDE,
TITLE OF INVENTION: SAME AND PROCESS FOR PRODUCING THE
TITLE OF INVENTION: INHIBITION PROCESS, DRUG COMPOSITION AND METHODS OF
TITLE OF INVENTION: TREATING USING THE SAME, AND ENZYME
TITLE OF INVENTION: TREATING USING THE SAME
                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

Patent No. 5837846
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Huston, James S.
APPLICANT: Houston, L. L.
APPLICANT: Ring, David B.
TITLE OF INVENTION: Biosynchetic Binding Proteins For TITLE OF INVENTION: Imaging
NUMBER OF SEQUENCES: 11
CORRESPONDENCE ADDRESS:
ADDRESSEE: Testa, Hurwitz & Thibeault/Patent Department
STREET: Exchange Place, 53 State Street

                                                                                                                                                                                                                                                               Sequence 307, Application US/08461965
Patent No. 5872098
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: George P. Vlasuk, Patric H. Stanssens,
APPLICANT: Joris H.L. Mensens, Marc J. Lauwereys,
APPLICANT: Yves R. Laroche, Laurent S. Jespers,
APPLICANT: Year R. Laroche, Laurent S. Jespers,
APPLICANT: Wantlow Gensemans, Matthew Moyle,
APPLICANT: Peter W. Bergum
TITLE OF INVENTION: NEMATODE-EXTRACTED ANTICOAGULANT
TITLE OF INVENTION: PROTEIN
NUMBER OF SEQUENCES: 356
CORRESPONDENCE ADDRESS:
ADDRESSEE: Lyon 6 Lyon

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
